## Zusammenfassung von JP6181460

**PURPOSE:** To provide a method for transmitting information which is regionally restricted in a common frequency broadcast network that does not disturb the common frequency broadcast of a transmission network and to provide a receiver. **CONSTITUTION:** On a transmission-side, one or more than one individual frequency carriers are additionally transmitted and the time sequence of regional information and individual carrier frequency is encoded and transmitted. On a reception side, information which is regionally differ is received, the individual carrier frequency and the time sequence are decoded and the individual frequency carrier is transmitted in one or more than one time slots in a transmission frame, which are synchronously used in the receiver till then.
